

Impianti OMS: New PU machines and mixing heads

Over the years OMS Group has consolidated its own image, producing evermore innovative polyurethane machines and plants and on this the new EL-series low pressure elastomer machine will be introduced.

This type of machine has been designed and developed for processing materials with high viscosity and having gel temperatures from 15 – 90 °C. The machine has therefore been designed to ensure there are no cold spots throughout the circuit and that materials are maintained at the optimal temperature.

Moreover, the display will include the complete range of high pressure self-cleaning mixing heads of the series **Y2K** and a series of low pressure mixing heads, in particular the new version **Ultimix Micro** especially designed for microdosing applications.
