

Frmo Group invites to the first PRe Day in Lotte

The German Frmo Group GmbH announced it would like to give its customers and business partners the opportunity to “experience PUR with Frmo”, so the company is hosting the first PRe Day on 14 November 2013 in Lotte, Germany.

The event will start already with a “get together” on **13 November 2013**. The actual **PRe Day** will begin with a round of presentations on the primary topics (cited below), and their practical applications will be examined in greater detail with live demonstrations in the **Frmo** TechCenter and production halls. The main topics of the first PRe Day at Frmo in **Lotte** will be:

- PRe Composites – for lightweight construction
- PRe Liner – for release agent-free foaming
- PRe Skin – for cost-effective variety with polyurethane or leather surfaces
- PRe Floor – new for seat cushion and carpet production
- PRe Mix – for multi-component metering and abrasive/corrosive materials

Moreover, the event will also focus on combined and integrated solutions as they are used for various products and their further processing, e. g. automated manufacturing lines with integrated process steps such as milling, joining, or assembly.

According to Frmo, the company is one of the market-leading full-service providers in the field of polyurethane processing. Its range of products and services includes the component- and production-based development and manufacture of a variety of moulds and tool carriers and their integration into a broad spectrum of equipment systems. The mixing and metering technology along with spraying technology, including all of the peripherals, complete the offering. For trials as well as production of samples, prototypes, and spare parts under customer contract, manpower resources and production equipment are available from the Frmo TechCenter and from Frmo BoParts, say the company. In the field of polyurethane processing Frmo says it has recently supported many pioneering developments all the way to market-readiness – on its own, under customer contract, or in collaboration with partners. This has resulted in numerous product enhancements, both with regard to its own moulds and systems, and also in connection with completely new developments and extensive test series and findings on new and innovative materials.
