
Bayer MaterialScience announces debottlenecking of MDI at Caojing

Bayer MaterialScience has just announced the debottlenecking of its MDI production facility at the Bayer Integrated Site Shanghai (BISS) in Caojing, Shanghai. The production capacity of the current facility will increase from 350,000 t/y to 500,000 t/y by mid-2014.

“MDI is an important raw material for the production of polyurethane rigid foam, which is an effective insulation material for buildings and refrigerators. The debottlenecking will allow the company to further expand its business in China, which is one of the largest markets in the world for **Bayer MaterialScience**,” said **Wolfgang Miebach**, President of Bayer MaterialScience China.
